
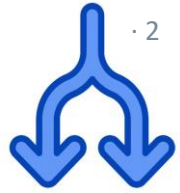
Practical Concurrent and Parallel Programming IX

Performance and Scalability

Jørgen Staunstrup

Agenda

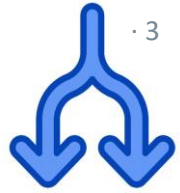


- **Executor and Future**

- Scalability, speed-up and loss (of scalablity) classification
  Example: QuickSort

- Lock striping
  - A case study with Hash maps

Java Executors - Tasks



Thread:

```
threads[t] = new Thread( () -> {
    ...
                for (int i=from; i<to; i++)
                    if (isPrime(i)) lc.increment();
});
```

Task:

```
public class countPrimesTask implements Runnable {
  ...
  @Override public void run() {
    if ((high-low) < threshold) {
      for (int i=from; i<=to; i++)
        if (isPrime(i)) lc.increment();  }
}
```

Prime counter task (skeleton)

```
public class countPrimesTask implements Runnable {
  private final int low;
  private final int high;
  private final ExecutorService pool;

  @Override public void run() {

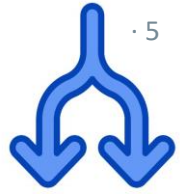
    int mid= low+(high-low)/2;
    pool.submit( new countPrimesTask(low, mid, pool) );
    pool.submit( new countPrimesTask(mid+1, high, pool) );

  }
}
```

Shortcomings:

1. How to stop?
2. Will create too many "small" tasks
3. Returning result (# primes)

Splitting tasks



```
@Override
  public void run() {
    if ((high-low) < threshold) {
      for (int i=low; i<=high; i++)  if (isPrime(i)) lc.increment();
    } else {
      int mid= low+(high-low)/2;
      pool.submit(new countPrimesTask(lc, low, mid, pool, threshold) );
      pool.submit(new countPrimesTask(lc, mid+1, high, pool, threshold) );
  }
}
```

Shortcomings:

1. How to stop?
2. ~~Will create too many "small" tasks~~
3. Returning result (# primes)

Future

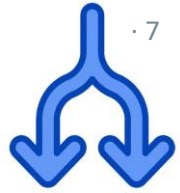
Futures are executors that deliver a result

```
T2:
  public Future<Integer> calculate(Integer input) {
    return pool.submit(() -> {
      ... // compute result
      return result;
    });
  }
}

T1:
  Future<Integer> future = T2.calculate(  );  // start
     ...
  future.get();
```

get() is a blocking call !!!!

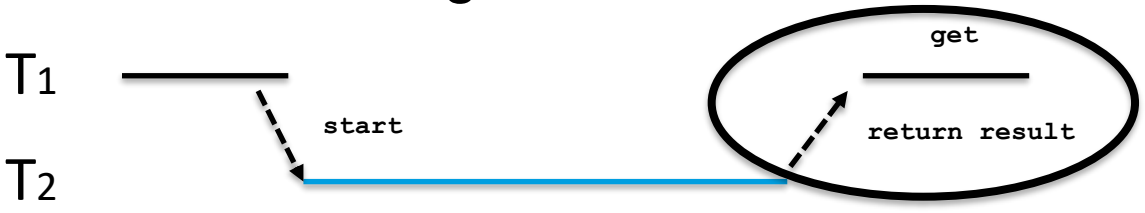
Splitting tasks



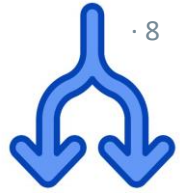
```
public void run() {
  if ((high-low) < threshold) {      ...
    } else {
      int mid= low+(high-low)/2;
      Future<?> f1= pool.submit( new countPrimesTask(lc, low, mid,
                                 pool, threshold) );
      Future<?> f2= pool.submit( new countPrimesTask(lc, mid+1, high,
                                 pool, threshold) );

    }
  }
```

But how do we get the results from a future?



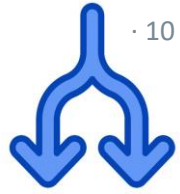
Combining tasks



```
public void run() {
  if ((high-low) < threshold) {      ...
    } else {
      int mid= low+(high-low)/2;
      Future<?> f1= pool.submit( new countPrimesTask(lc, low, mid,
                                 pool, threshold) );
      Future<?> f2= pool.submit( new countPrimesTask(lc, mid+1, high,
                                 pool, threshold) );
      try {  f1.get();f2.get(); }
      catch (InterruptedException | ExecutionException e) {   }
    }
  }
```

1: Does the order of f1.get and f2.get matter?

Splitting tasks



```
public void run() {
  if ((high-low) < threshold) {     ...
    } else {
      int mid= low+(high-low)/2;
      Future<?> f1= pool.submit( new countPrimesTask(lc, low, mid,
                                 pool, threshold) );
      Future<?> f2= pool.submit( new countPrimesTask(lc, mid+1, high,
                                 pool, threshold) );
      try {  f1.get();f2.get(); }
      catch (InterruptedException | ExecutionException e) {   }
    }
  }
```

Shortcomings:

1. ~~How to stop?~~
2. ~~Will create too many "small" tasks~~
3. Returning result (# primes)

Combining tasks

```
public void run() {
  if ((high-low) < threshold) {      ...
    } else {
      int mid= low+(high-low)/2;
      Future<?> f1= pool.submit( new countPrimesTask(lc, low, mid,
                                 pool, threshold) );
      Future<?> f2= pool.submit( new countPrimesTask(lc, mid+1, high,
                                 pool, threshold) );
      try {  f1.get();f2.get(); }
      catch (InterruptedException | ExecutionException e) {   }
    }
  }
```

Shortcomings:

1. ~~How to stop?~~
2. ~~Will create too many "small" tasks~~
3. Returning result (# primes)

How do we get the result # primes ?

Counting the primes

```
public void run() {
  if ((high-low) < threshold) {      ... lc.increment();
    } else {
      int mid= low+(high-low)/2;
      Future<?> f1= pool.submit( new countPrimesTask(lc, low, mid,
                                 pool, threshold) );
      Future<?> f2= pool.submit( new countPrimesTask(lc, mid+1, high,
                                 pool, threshold) );
      try {  f1.get();f2.get(); }
      catch (InterruptedException | ExecutionException e) {   }
    }
  }
```

Shortcomings:

~~1. How to stop?~~

~~2. Will create too many "small" tasks~~

~~3. Returning result (# primes)~~ **Final value in lc**

countPrimesTask

```
public class countPrimesTask implements Runnable {
  private final int low;
    ...

  private static boolean isPrime(int n) {
    ...
  }

  public countPrimesTask(PrimeCounter lc, int low, int high,
   ExecutorService pool, int threshold) {
    this.lc        = lc;
    ...
  }

  @Override
  public void run() {
    ...
  }
}
```

Java Executors - Tasks

- Ideally, tasks should be independent i.e. not update shared variables

countPrimesTask class

```
public class countPrimesTask implements Runnable
  private final int low;  private final int high
  private final ExecutorService pool;
  private final PrimeCounter lc;

  private static boolean isPrime(int n) {...)
  }

  public countPrimesTask(PrimeCounter lc... ) {this.lc= lc;...  }

  @Override
  public void run() {
    if ((high-low) < threshold) {
      for (int i=low; i<=high; i++) if (isPrime(i)) lc.increment();
   } else {
      int mid= low+(high-low)/2;
      Future<?> f1= pool.submit( new countPrimesTask(lc, ... ) );
      Future<?> f2= pool.submit( new countPrimesTask(lc, ... ) );
      try {  f1.get();f2.get();      }
      catch (InterruptedException | ExecutionException e) {   e.printStackTrace();
}
    }
  }
}
```

2: Are countPrimesTasks independent?

Code in `countPrimesTask.java`

countPrimesTask class

```
public class countPrimesTask implements Runnable {
  private final int low;  private final int high;  priva
  private final ExecutorService pool;
  private final PrimeCounter lc;

  private static boolean isPrime(int n) {...)
  }

  public countPrimesTask(PrimeCounter lc... ) {this.lc= lc;...  }

  @Override
  public void run() {
    if ((high-low) < threshold) {
      for (int i=low; i<=high; i++) if (isPrime(i)) lc.increment();
   } else {
      int mid= low+(high-low)/2;
      Future<?> f1= pool.submit( new countPrimesTask(lc, ... ) );
      Future<?> f2= pool.submit( new countPrimesTask(lc, ... ) );
      try {  f1.get();f2.get();      }
      catch (InterruptedException | ExecutionException e) {  e.printStackTrace();      }
   }
  }
}
```

Not really, they all update lc

PrimeCounter

```
class PrimeCounter {

  private int count= 0;
  public synchronized void increment() {
    count= count + 1;
  }
  public synchronized int get() {
    return count;
  }
  public synchronized void setZero() {
    count= 0;
  }
}
```

PrimeCountExecutor class

- Kick-off class for the program
- It initializes the Executor service

```
class PrimeCountExecutor {
   private ExecutorService pool;
     ...
   public PrimeCountExecutor () {
     pool= new ForkJoinPool();
     Future<?> done= pool.submit(new countPrimesTask( ... ));

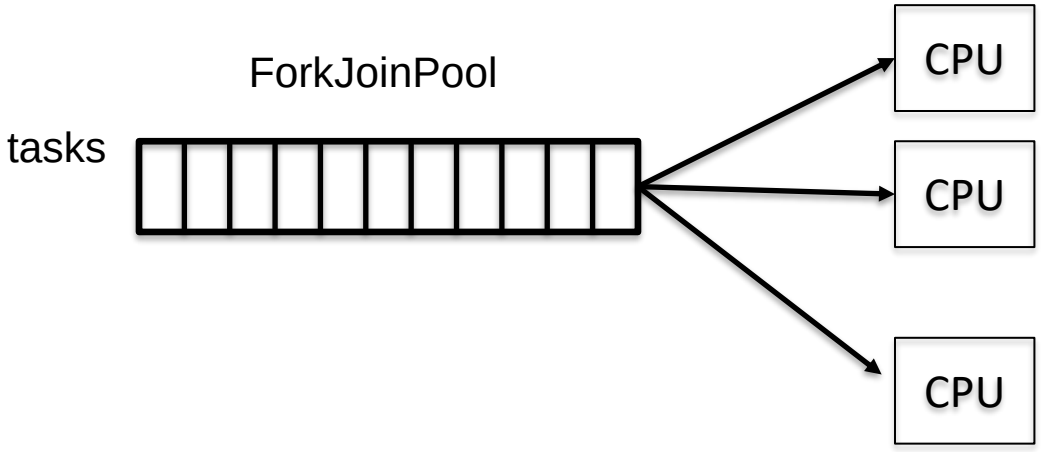
     try {  done.get();  }

    }
}
```

https://docs.oracle.com/javase/tutorial/essential/concurrency/forkjoin.html

Thread pools

```
class PrimeCountExecutor {
   private ExecutorService pool;
     ...
   public PrimeCountExecutor () {
     pool= new ForkJoinPool();
     ...
}
```



ForkJoinPool

```
import java.util.concurrent.ForkJoinPool;
import java.util.concurrent.ExecutorService;
import java.util.concurrent.Future;

class PrimeCountExecutor {
   private ExecutorService pool;
     ...
   public PrimeCountExecutor () {
     pool= new ForkJoinPool( n );
     ...

    }
}
```

n specifies the number of CPUs that will be used

default value: Runtime.availableProcessors()

https://docs.oracle.com/javase/8/docs/api/java/util/concurrent/ForkJoinPool.html

Count prime results

Executor	Threads
1 120.6 s	1 126.7 s
2 68.0 s	2 82.4 s
4 37.7 s	4 47.7 s
8 32.2 s	8 38.2 s
16 32.4 s	16 37.2 s
1/8: 3.7	1/8: 3.9

range 2.. 1_000_000

Agenda

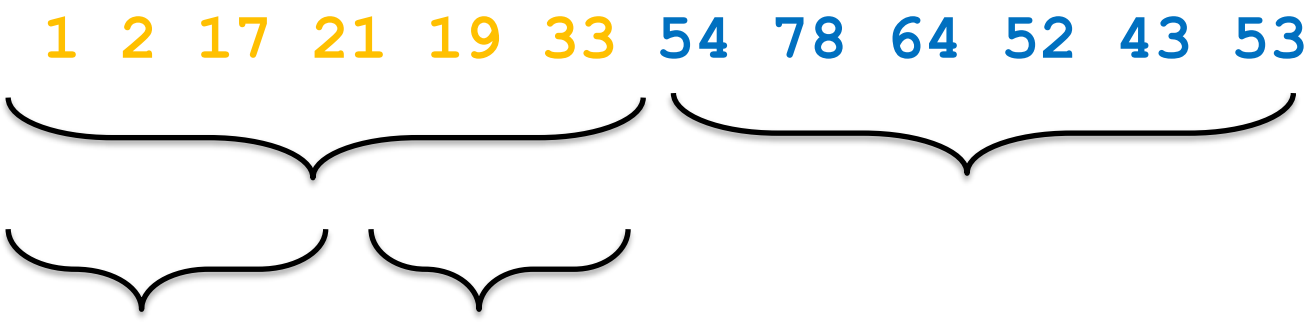
- Executors and Future
- **Scalability, speed-up and loss (of scalablity) classification**
  Example: QuickSort
- Lock striping
  - A case study with Hash maps

Quicksort

```
1  2  43  78  19  54  33  21  64  52  17  53
1  2  43  78  19  54  33  21  64  52  17  53
1  2  43  78  19  54  33  21  64  52  17  53
      ↑                               ↑
1  2  17  78  19  54  33  21  64  52  43  53
      ↑                               ↑
1  2  17  78  19  54  33  21  64  52  43  53
         ↑                   ↑
                  ...
1  2  17  21  19  33  54  78  64  52  43  53
1  2  17  21  19  33  54  78  64  52  43  53
```

Two parts can be sorted independently

Distributing work as tasks



…

No further splitting when the sorting problem is smaller than a threshold (similarly to what we did for prime counting)

These tasks may differ in size !!

Quicksort executor (pseudo code)

```
class QuicksortTask implements Runnable {
  Task p;  // low and high boundaries
  ExecutorService pool;

  @Override  public void run() { qsort(p, pool, ... ); }

  public static void qsort(Task p, ExecutorService pool, ... ) {
     //split task in two: Low and High as shown on previous slides

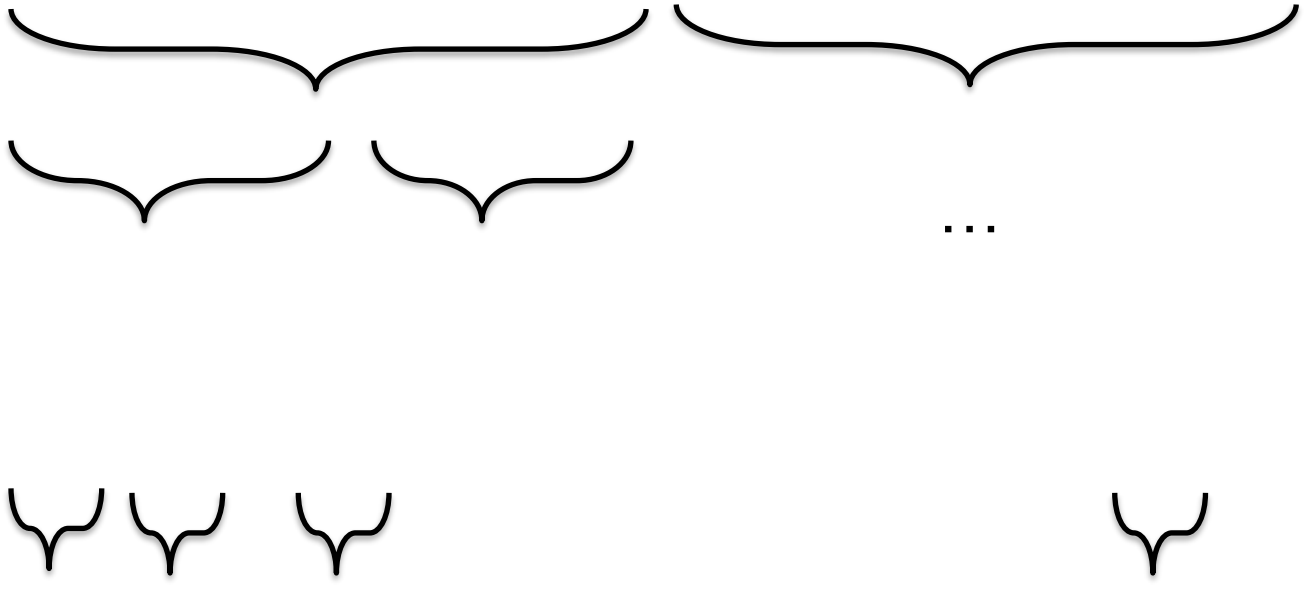
    if (Low.size>= threshold) pool.submit( new QuicksortTask( pLow, pool, ... ))
     else Quicksort(pLow); //sequential sort

    if (High.size>= threshold) pool.submit( new QuicksortTask( pHigh, pool, ... ))
     else Quicksort(pHigh);

  }
}
```

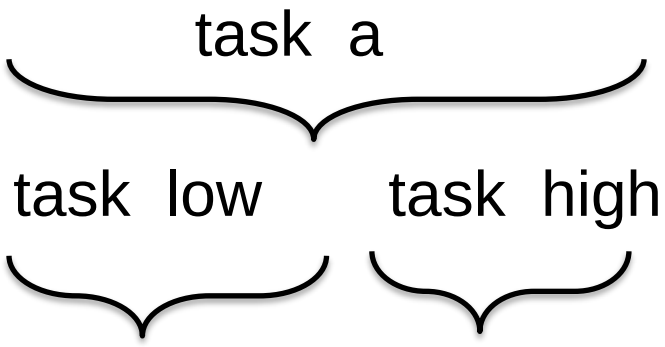
Code in QuickSortTask.java

Termination (Quicksort)



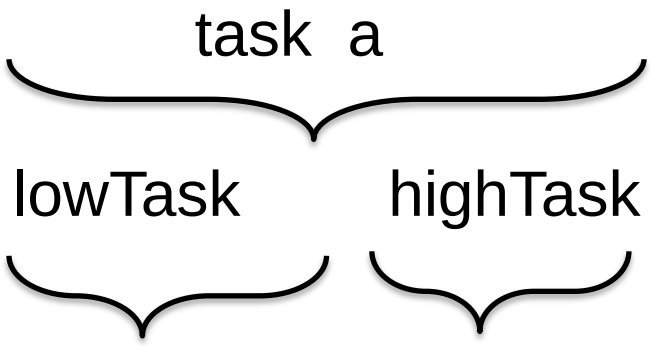
How do we know when all task are done?

Termination



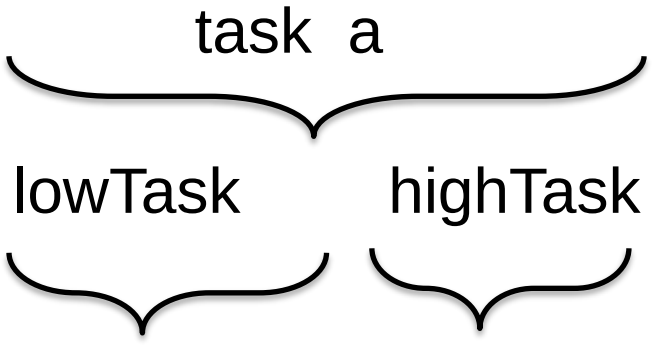
3: When can task a finish?

Termination



task a can finish when **both** task low and task high have finished

Termination



`lowTask.get()` returns when lowTask has finished

`highTask.get()` returns when highTask has finished

```
@Override
 public void run() { // modified Quicksort using Executor tasks
      ...

   //Waiting for longest running subtask to finish
   try {
     lowTask.get();
     highTask.get();
   } catch (InterruptedException | ExecutionException e) { e.printStackTrace(); }
 }
```

Quicksort Executor

Code in QuickSortTask.java

```
@Override
 public void run() { // modified Quicksort using Executor tasks
   int a= low;  int b= high;
   Future<?> lowTask= null;    Future<?> highTask= null;

   if (a < b) { … // split array in two independent part

     if ((j-a)>= threshold)
       lowTask= pool.submit(new QuickSortTask(arr, a, j, pool, threshold));
     else // all remaining work done without starting more tasks
       SearchAndSort.qsort(arr, a, j);

     if ((b-i)>= threshold)
       highTask= pool.submit(new QuickSortTask(arr, i, b, pool, threshold));
     else // all remaining work done without starting more tasks
       SearchAndSort.qsort(arr, i, b);
   }

   //Waiting for longest running subtask to finish
   try {
     if (lowTask != null ) lowTaskF.get();
     if (highTask != null) highTaskF.get();
   } catch (InterruptedException | ExecutionException e) { e.printStackTrace(); }
 }
```

Benchmarking Quicksort

"Measure, don't guess"
Goetz p. 224

We use Mark8Setup to measure runtime

```
private static void runSize(ExecutorService pool, int pSize, int threshold, int n) {
  final int[] intArray= fillIntArray(pSize);
  Benchmark.Mark8Setup("Quicksort Executor", String.format("%2d", n),
    new Benchmarkable() {

      public void setup() {
        shuffle(intArray);
      }

      public double applyAsDouble(int i) {
        Future<?> done= pool.submit(new QuickSortTask(intArray, 0, pSize-1, pool, threshold));
        PoolFinish(done);
        //testSorted(intArray); //only needed while testing
        return 0.0;
      }
    }
  );
}
```

See benchmarkingNotes in week8

Code in PoolSortingBenchmarkable.java

Sorting results

Does not scale perfectly

Executor	
1	8.5 s
2	4.8 s
4	2.6 s
8	2.2 s
16	2.2 s

Speed-up
1/8: 3.9

Threads	
1	11.2 s
2	6.4 s
4	3.8 s
8	3.2 s
16	3.5 s

Speed-up
1/8: 3.9

Sorting 100_000 numbers

What limits scalability?

Example: growing a crop

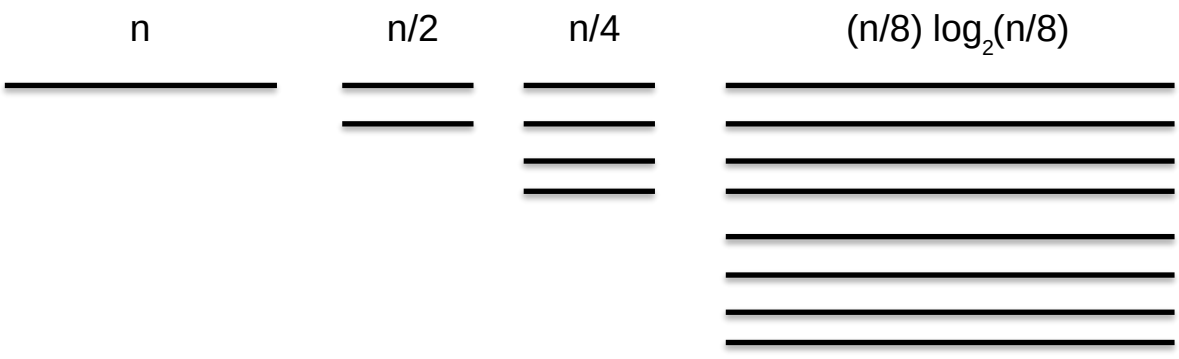
- 4 months growth + 1 month harvest if done by 1 person
- Growth (sequential) cannot be speeded up
- Using 30 people to harvest, takes 1/30 month = 1 day
- Speed-up using many harvesters: 5/(4+1/30) = 1.24 times faster

Amdahl's law (Goetz 11.2)

F = sequential fraction of problem e.g. 4/5 = 0.8
N = number of threads (people) e.g. 30

Speed-up <= 1/(F+(1-F)/N) = 1/(0.8+0.2/30) = 1.24

Maximum speed-up Quicksort



Best case

$$R(n) = n + n/2 + n/4 + (n/8)\log_2(n/8)$$

$$1{,}75n + (n/8)\log_2(n/8)$$

Amdahl: Starvation loss

$$\text{Max speed-up} = \frac{1{,}75n + (n/8)\log_2(n/8)}{n \log_2(n)}$$

n= 100.000
Max speed-up ~ 4.8

Loss of scalability (much more than Amdahl)

- Starvation loss (Amdahl)
  - Minimize the time that the task pool is empty

QuickSort

- Separation loss (best threshold)
  - Find a good threshold to distribute workload evenly

Prime count

- Saturation loss (locking common data structure)
  - Minimize high thread contention in the problem
- Braking loss
  - Stop all tasks as soon as the problem is solved

String search

Møller-Nielsen, P and Staunstrup, J, Problem-heap. A paradigm for multiprocessor algorithms. *Parallel Computing*, 4:63-74, 1987

Shut down

The ExecutorService can be shut down.

```
// Executor body
...
...

pool.shutdown();
```

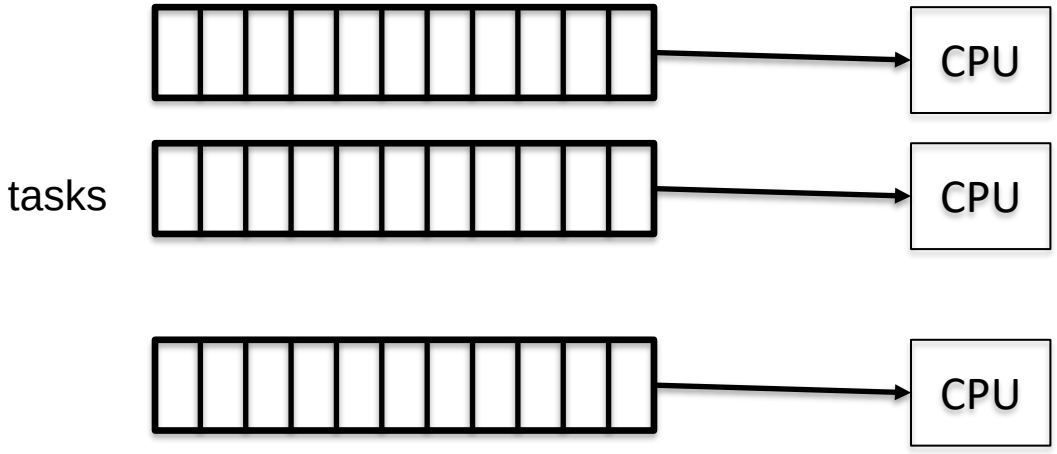
The challenge is often *when to shut down*

After shutdown the pool cannot be reused,
but you may assign it a new value (of type **`ExecutorService`**)

Thread pools

```
class PrimeCountExecutor {
   private ExecutorService pool;
     ...
   public PrimeCountExecutor () {
     pool= newFixedThreadPool(3);

     ...
}
```

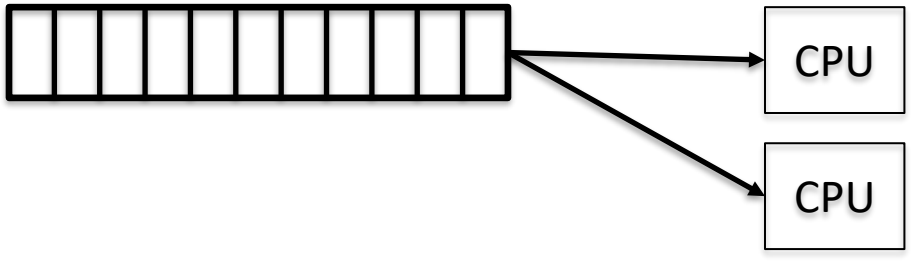


https://docs.oracle.com/javase/tutorial/essential/concurrency/pools.html

Thread pools

```
class PrimeCountExecutor {
   private ExecutorService pool;
     ...
   public PrimeCountExecutor () {
     pool= newWorkStealingPool(x);

     ...
}
```



tasks

Quite a few more
types of ExecutorService

Runnable vs. Callable

Both are used to specify the code of a task.

- Runnable cannot return a result
  - Overrides run()
- Callable returns a result (via a Future)
  - Overrides call()

As illustrated by the Quicksort and countPrimes examples, Runnables may use shared data (e.g., to deliver a result)

Submit vs Execute

Both are used to spawn a task

- **`pool.execute`** does not return a result
  may complicate determining when to finish
- **`pool.submit`** returns a result (via a Future)

https://docs.oracle.com/javase/8/docs/api/java/util/concurrent/Executor.html

Agenda

- Executors and Future
- Scalability, speed-up and loss (of scalablity) classification
  Example: QuickSort
- **Lock striping**
  - **A case study with Hash maps**

Java Collections

A *collection* is simply an object that groups multiple elements into a single unit

Package: java.util

Examples: ArrayList, HashMap, TreeSet, …

https://docs.oracle.com/javase/tutorial/collections/intro/index.html

Methods: add, remove, size, contains, …

Many of the classes have thread-safe/concurrent implementations

https://www.baeldung.com/java-synchronized-collections

Example: synchronizedCollection

```
import java.util.*;
public class syncCollectionExample {
  public static void main(String[] args) {  new syncCollectionExample(); }

  public String getLast(ArrayList<String> l) {
    int last= l.size()-1;
    return l.get(last);
  }

  public static void delete(ArrayList<String> l) {
    int last= l.size()-1;
    l.remove(last);
  }

  public syncCollectionExample() {
    ArrayList<String> a= new ArrayList<String>(); // Collection
    a.add("A");  ...

    Collection<String> synColl = Collections.synchronizedCollection(a);
    ...
  }
}
```

Thread-safe
(but no locking !!!!)

Goetz p. 80

Example: synchronizedCollection

```
import java.util.*;
public class syncCollectionExample {
  public static void main(String[] args) {  new syncCollectionExample(); }

  public String getLast(ArrayList<String> l) {
    int last= l.size()-1;
    return l.get(last);
  }

  public static void delete(ArrayList<String> l) {
    int last= l.size()-1;
    l.remove(last);
  }

  public syncCollectionExample() {
    ArrayList<String> a= new ArrayList<String>();
    a.add("A");  ...

    Collection<String> synColl = Collections.synchronizedCollection(a);
    ...
  }
}
```

4: Is this version thread-safe?

Goetz p. 80

Example: synchronizedCollection

```
import java.util.*;
public class syncCollectionExample {
  public static void main(String[] args) {  new syncCollectionExample(); }

  public String getLast(ArrayList<String> l) {
    int last= l.size()-1;
    return l.get(last);
  }

  public static void delete(ArrayList<String> l) {
    int last= l.size()-1;
    l.remove(last);
  }

  public syncCollectionExample() {
    ArrayList<String> a= new ArrayList<String>();
    a.add("A");  ...

    Collection<String> synColl = Collections.synchronizedCollection(a);
    ...
  }
}
```

No

(because there is not a happens-before relation between the writes and reads in the two methods)

Goetz p. 80

Thread-safety (from week 3)

It is very important to note that for a program *p*:

p only accesses thread-safe classes

$\not\Rightarrow$

p is a thread-safe program

Making the synchronized ArrayList thread safe

```
import java.util.*;
public class syncCollectionExample {
  public static void main(String[] args) {  new syncCollectionExample(); }

  public String getLast(ArrayList<String> l) {
    synchronized(l) {
      int last= l.size()-1;
      return l.get(last);
    }
  }

  public static void delete(ArrayList<String> l) {
    synchronized(l) {
      int last= l.size()-1;
      l.remove(last);
    }
  }

  public syncCollectionExample() {
    ...
  }
}
```

But then the advantage of the synchronized collections is lost !!

Goetz p. 80

What if the data structure is huge?

and used by many threads?

for example:

- a bank
- Facebook updates
- …

Would not work if everything is "synchronized"

What can we do?

Reduce locking !!

Example: A huge HashMap

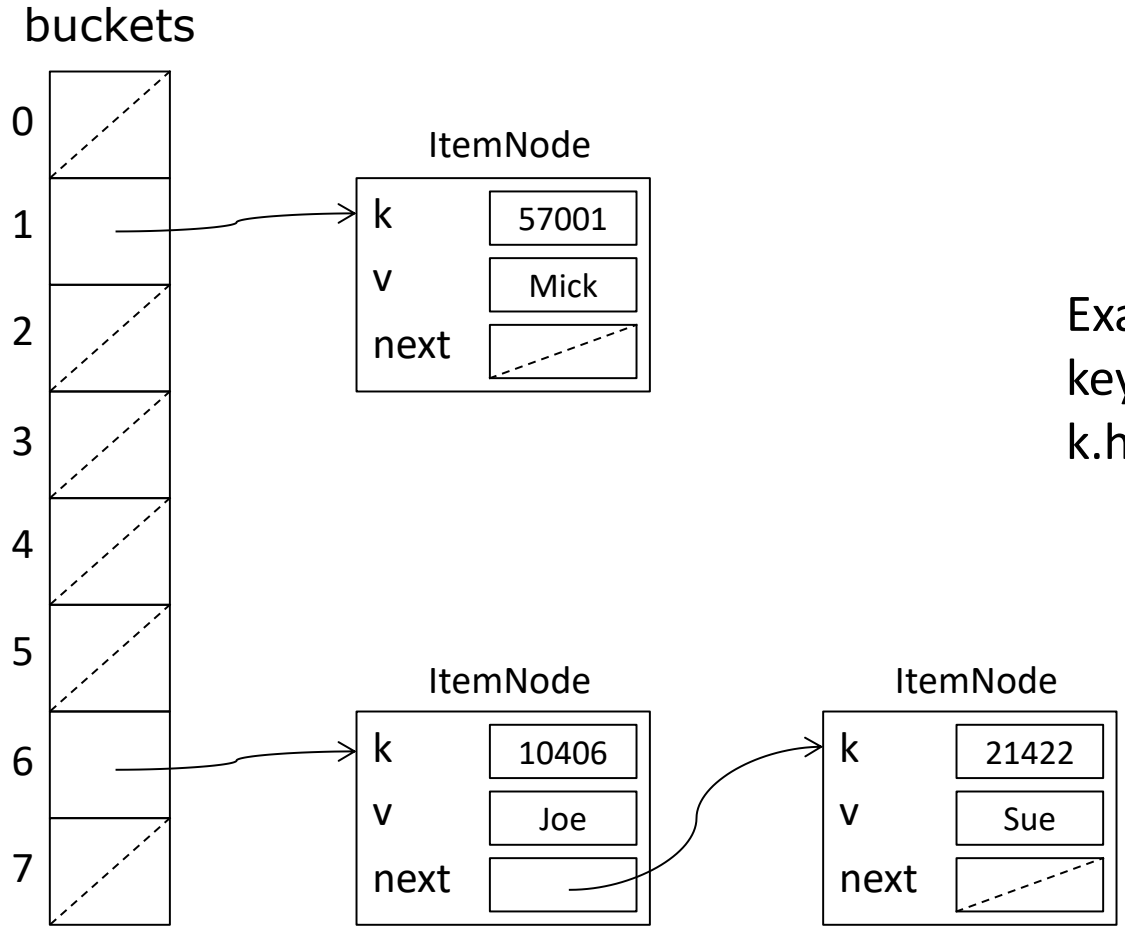
Key	Value
Peter	20487612
Anna	51251218
Lena	34458318
Holger	89545010
Lisa	94959500

Key value pairs: <k1, v1>, <k2, v2>, …

```
class HashMap<K,V> {
  ...  // data structure
  public V get(K k) { ... }
  public V put(K k, V v) { ... }
  public boolean containsKey(K k) { ... }
  public int size() { return cachedSize; }
  public V remove(K k) { ... }
  ...
}
```

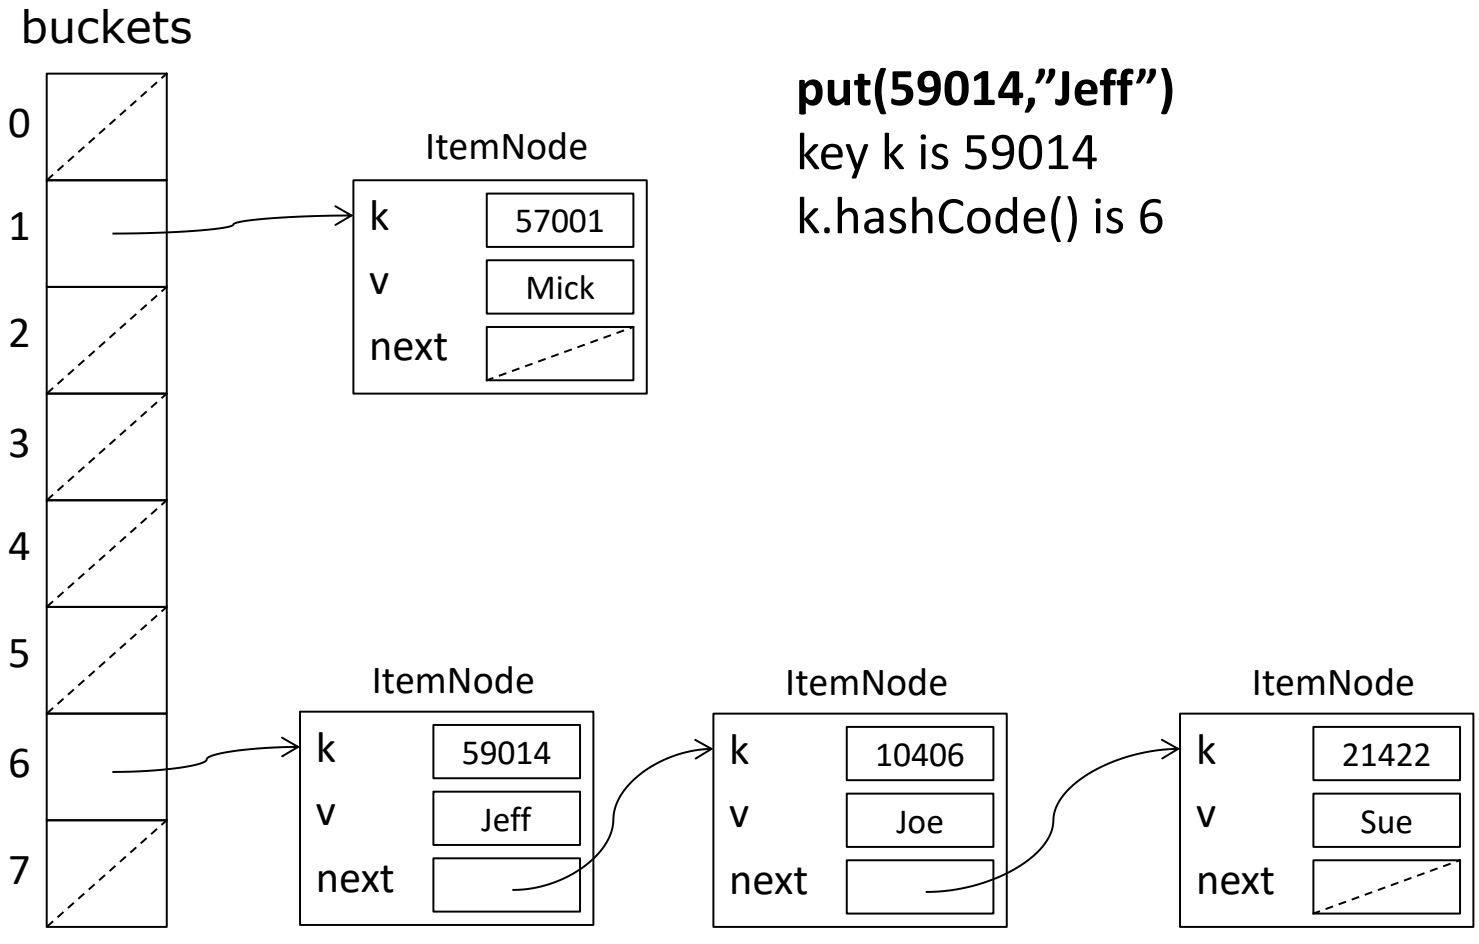
How to make it thread-safe?
(without making all the methods synchronized)

HashMap implementation



Example **get(10406)**
key k is 10406
k.hashCode() is 6

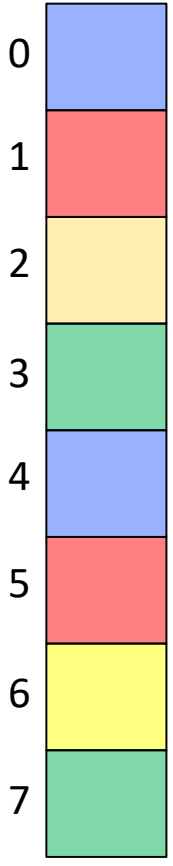
HaspMap put



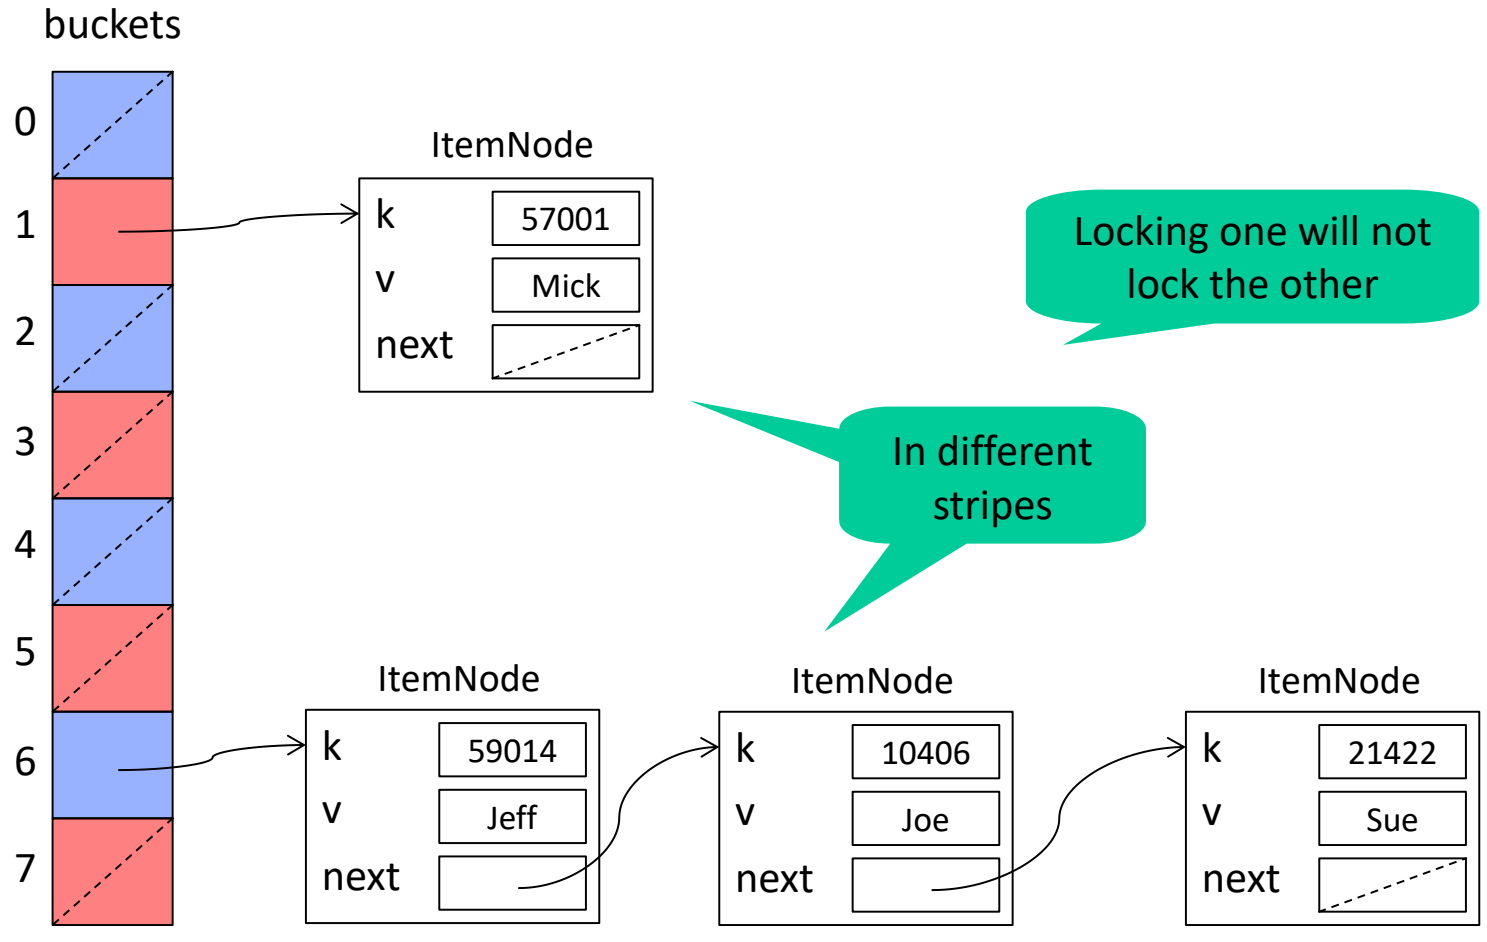
put(59014,"Jeff")
key k is 59014
k.hashCode() is 6

Improving scalability – Lock striping

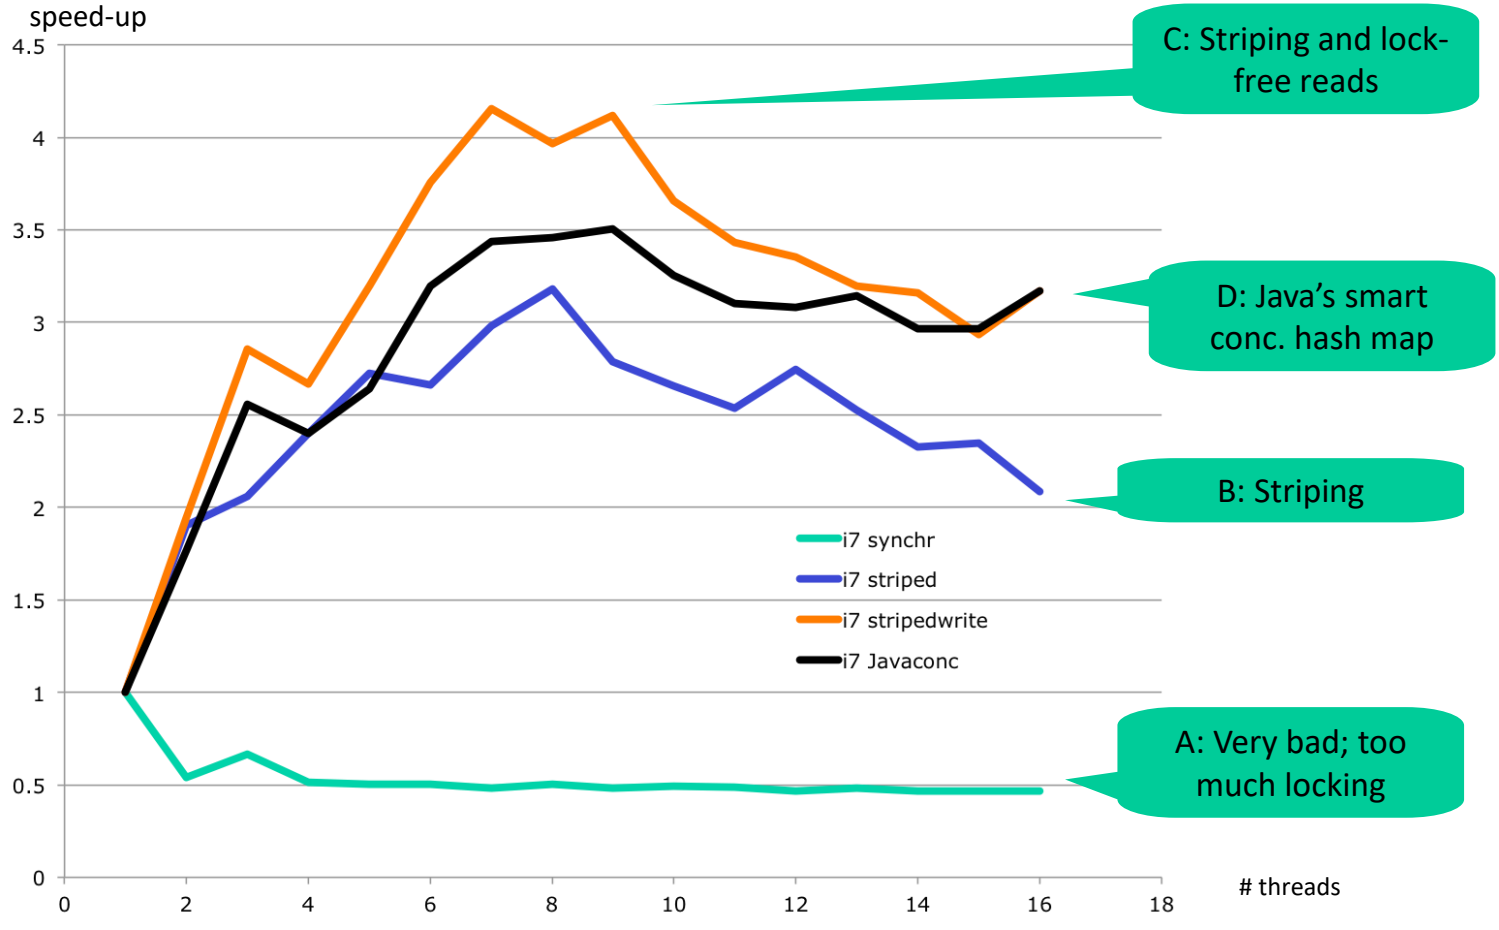
- Guarding the table with a single lock works
  - ... but does not scale well (actually **very** badly)
- Idea: Each bucket could have its own lock
- In practice
  - use fewer, to illustrate we use 4, locks
  - guard every 4th bucket with the same lock
  - locks[0] guards bucket 0, 4, 8, ... (stripe 0)
  - locks[1] guards bucket 1, 5, 9, ... (stripe 1) et
  - With high probability
  - two operations will work on different stripes
  - hence will take different locks
- Less lock contention, better scalability



Bucket idea



Reducing locking



Ultimate scalability

A web-shop, Facebook, …

We must give up thread safety,

but still maintain some sort of consistency
